#### PREFACE

This Table of Equivalents is intended to facilitate the use, by metrologists, of the older volumes of the British Museum Catalogues of Coins especially, and generally of English works on numismatics, in which the weights of coins are given in Troy grains to one place of decimals. As all metrological investigation is now conducted according to the metric system, it is necessary to convert these data into their metric equivalents. The Table proceeds continuously by tenths of a grain from 0·1 grain to 351 grains. It then rises by one grain to 400 grains; then by tens to 500 grains. The basis of ealeulation is 1 grain = ·06479895 gramme, which is derived from the equation 1,000 grammes = 15432·34874 grains.¹ The results have been checked on a Brunsviga calculating machine.

For all ordinary numismatic purposes it is sufficient to carry the metric equivalents to two places of decimals, weighting the figure in the second place where necessary. But in order that the Table may be used to ealculate higher numbers not included in it, the equivalents from 0.1 to 0.9 grains, as well as of all integral numbers of grains,

are given to four places of decimals.

For the convenience of students, a Table for converting English inches into millimetres and the measures of Mionnet's scale has been appended.

G. F. HILL,

Keeper of Coins.

British Museum, April 1920.

<sup>1</sup> See W. H. Miller, quoted by J. D. Everett, Units and Physical Constants (1886), p. 2.
